This supplemental document shows two screenshots proving idea and result provenance. The file resides on a personal USB stick.

supplemental figure 1: The file is dated to July 8th, 2021.

random

- investigate senses wrt psychedelics
 - LSD anecdata, clear humans sense more of surrounding than is recognized by the conscious
 - see blood vessel vibrations underneath skin
 - feel gut movement otherwise ignored
 - feel ear pain from listening to loud music all the time
 - when looking at faces, detail is scrutinized much more closely
 - corroborated by science:
 - PNAS study showing resultant diffusion of brain activity and wiring under LSD
 - in line with face recognition observations: fusiform gyrus devoted explicitly to such a task
 - therefore rewiring apportions more conscious to recognizing such facial details

supplemental figure 2: Core observations of this paper are shown here.
